

a Particle market model

N agents $s_i \in \mathbb{R}^d$

overdamped Langevin + MACE-lite force;
fully differentiable

b Controlled intervention

c Four controlled results

1 Measurement correction

warm-up inflates the tail

2 Driven transient

heavy tail only out of equilibrium

3 Mechanism + OFI signature

coordinated flow, not price shocks

4 Real-market boundary

returns stationary $\Rightarrow$ OF prediction
